    <TITLE>Point of sale, informational and data transfer system comprised of
      hardware and software applications for the home and business, through
      infrared and direct connection.For use with PDA's, Laptopsm, TV's, and
      custom hardware component.</TITLE>
    <LANGUAGE>EN</LANGUAGE>
- <ABSTRACT>
    <P>WHAT IS "HANDHELD HQ" "HandHeld HQ" is an external infrared
      transmitter and receiver connected to a computer terminal (desktops,
      terminal nodes, laptops, or "HandHeld HQ kiosks). The signal can be
      transmitted to or received from handheld devices such as Palm Pilots or
      other similar devices using identifiable O/S. Examples: Apple/Macintosh
      (if and when available), Microsoft Platforms (Windows 95, 98, ME, 2000,
      CE, NT) Palm O/S, Handspring's Visor (same O/S as Palm), Sony Clio
      (same O/S as Palm), Linux and Unix (if and when available), etc.</P>
    <P>The signal transmitted will be used to either upload information to or
      download information from the two "connected" devices. The technology
      for infrared transmission is wide spread and has been available for
      several years. Only recently has the popularity become noticeable, with
      the growing popularity of handheld devices, most noticeably the Palm
      Pilot. The applications we have designed are new, as well as the concept
      of the hardware required to perform these tasks. The potential for the
      hardware and its associated applications are enormous.</P>
    <P>WHAT IS "SuperSync" "SuperSync" is a device designed to operate
      either in conjunction with the HandHeld HQ external infrared
      transmitter/receiver, or it can be operated independently, by connecting
      to a computer through the wide variety of I/O connectors. Where as the
      Handheld HQ is designed to transmit signals via infrared signal, the signal
      transmitted through the SuperSync will be through a direct connection to
      the computer when transferring via infrared is undesired or impractical.
      The purpose of this device is to enable the wide variety of PDA hand held
      computers to up/download information between itself and the host
      computer or network node. The SuperSync will accomplish this by having
      the multiple connectors to operate with the wide variety of proprietary
      input/output connectors of the PDA's in the marketplace, both present
      and future.</P>
    <P>These products are designed to create a consistent revenue stream that
      will extend beyond the initial PDA purchase. Controlling the future
      pathway of content is a key to success.</P>
    <P>WHAT ARE "Pocket Rx and Pocket Parts" The Pocket Rx is a small
      device approximately the size of a thumb. It is designed to receive, store,
      and later transmit information. The information to be transmitted into the
      Pocket Rx is intended to be prescriptions to pharmacies using HandHeld
      HQ or other IR receiver as well as through a USB data transfer. The
      Pocket Parts is identical in design but is intended for use by those in the
      new and used automobile parts industry. WHAT IS "TV Sync" TV Sync is
      the redesigning of the IR port on Television sets. The modification will
      allow TVs to transmit signals that will be retrievable by PDAs. These
      signals will be embedded within commercials and broadcasts.</P>
